III NOTICES OF INTENT

Town of Barnstable/Conservation Division. Mystic Lake, a 148 acre deep kettlehole lake located in Marstons Mills, Barnstable, experiences chronically low oxygen in its bottom waters during summer. Under these conditions, phosphorus is released from the bottom sediments. This internal release of stored nutrients is the primary source of total phosphorus to the lake, which is leading to increasing productivity in the form of algal blooms. To significantly reduce the internal phosphorus recycling and improve ecological and recreational functions of the lake, a nutrient inactivation (i.e., alum) treatment is proposed. **SE3-_____**
